AUTOMATED METER READING INTERFACE

The interface between **UTILITY BILLING** and any manufacturer's Automatic Meter Reading (AMR) system uploads and downloads customized predefined text file formats. Some of the major AMR systems we currently interface with are Sensus, Badger, Neptune, Invensys, Schlumberger, and Radix.

Quickly upload meter reading information for routes in a few simple steps that create the upload text file which, once completed, formats and loads data directly into the AMR device.

After the meters have been read, the **AUTOMATED METER READING INTERFACE** downloads the data into a text file for further processing. Again, in a few simple steps, these new readings are efficiently added to the database and are immediately available for reporting.

Documentation (in Microsoft Word) is fully customizable with simple uploading and downloading.
